# 1. PVRTexTool GUI

PVRTexTool GUI is used to convert image files (BMP, TGA, GIF, PCX, JPG, PNG) files into hardware-friendly texture files. This is a Graphical User Interface program, available for Windows and Linux. Only the PVRTexTool GUI executable is required to run the program.

## 1.1. Texture Viewer

This window can display the currently selected MIP-map level of a texture in a number of different ways, along with some diagnostic information.

**1. View Panels** – Show the current image data before and after encoding, on a chequered background. If the image has transparency, it will be alpha blended with the background. The image can be moved around by clicking and dragging.

**2. Zoom** – Use this slider to zoom in and out of the image. The zoom feature can also be operated using the mouse wheel on either of the view panels.

**3. Display mode** – Selects how the image should be displayed. If the file is a normal 2D texture, you can choose between a single and a tiled view. If you are viewing a cube map, you can choose between a single view of the currently selected face and a 3D preview.

**4. Channels** – Un-checking each of these tick boxes will suppress the corresponding channel in the view panels. For example, if “A” is unchecked, alpha blending will be turned off. This pane also gives numerical values for each of the channels at the current cursor position, and the position on the texture. Values to the left are taken from the input texture; values from the right are from the output texture.

**5. Difference** – Activate the checkbox to display a representation of the difference between the original image data, and the image after it has been encoded, to highlight compression artefacts. Ticking the box will enable a slider which controls the intensity of this image, with a scale factor from 1 to 9.

## 1.2. Image Browser

**1. MIP-map browser** – Shows a list of all MIP-map levels in the texture. Click on a MIP-map to view it in the texture viewer.

**2. Load level** – Load an image into the currently selected MIP-map level.

**3. Load alpha** – Load an image as the alpha for the currently selected MIP-map level.

**4. Save level** – Saves an image of the current MIP-map level once it has been encoded in the specified format, then decoded.

**5. Generate MIP-maps** – Uses the currently selected MIP-map to generate all smaller MIP-maps.

## 1.3. File Menu

### 1.3.1. Open...

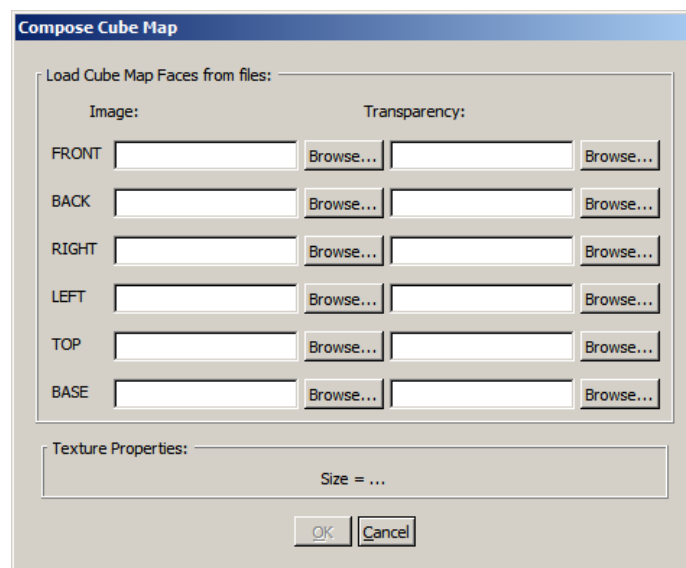

Use File | Open, to open a previously created texture file, or to open a standard image file as a texture. PVRTexTool supports POWERVR texture files (\*.PVR), and Microsoft Direct Draw Surface files (\*.DDS). It can also read the following image formats: BMP, TGA, GIF, PCX, JPG and PNG.

### 1.3.2. Open with Alpha...

Use File | Alpha to bring up a dialog for combining two image files to produce a texture with an alpha channel as well as RGB data. Specifying only an alpha image will produce a white texture with only the alpha channel filled.

### 1.3.3. Compose Cube Map...

Use this option to create a cube map texture by combining existing images. It allows you to specify image files from which to load each of the six faces of the cube and an optional transparency image for each one. All of these source images must be of identical, square dimensions.

### 1.3.4. Reload From File

This option reloads the current texture from disk reverting any pre-processing already carried out upon it. If the file has been updated in some way by another program since being opened this also allows the texture in memory to be updated to what is currently stored on disk. Any encoded data produced is discarded by this operation.

### 1.3.5. Save/Save As

The user can save the texture in different formats:

- .PVR files. The data consists of a 12 bytes header (described in section 4) followed by the raw texture data.
- .H files which are like .PVR file but in a format that allows including it in a C project. The default type for the data is currently 'unsigned long' although the legacy mode ('unsigned char') is still supported as an option. We recommend using the default mode to avoid alignment problems in some platforms enhancing portability of these textures files.
- .DDS files. Files ready for use in Microsoft DirectX. See the DirectX documentation for a detailed description.
- .NGT files. Files ready for use with Nokia's NGAGE 2 SDK. See the NGAGE 2 documentation for a detailed description.
- An image file of the format (BMP, TGA, GIF, PCX, JPG and PNG). MIP-map information will be discarded when these formats are chosen – use Save MIP-level from the Edit menu for this functionality. A decompressed version of the encoded data that will be saved.

The user will be prompted to select a texture encoding format, if the texture hasn't already been encoded through the usual encoding dialogue (described below).

### 1.3.6. Close/Close All

These options variously close the active document window or all open windows.

### 1.3.7. Quit

Exit PVRTexTool.

## 1.4. Edit Menu

### 1.4.1. Preprocess...

This option brings up a pre-processing dialog box showing all the procedures which can be performed on the texture prior to encoding.

#### Options

##### Generate Normal Map

A normal map is a texture that stores normal vectors instead of colours. The X component of the normal vector is stored in the red channel of the texture, the Y component in the green channel and the Z component in the blue channel. Normal maps are commonly used with Dot3 bump mapping. The normal map is calculated from a grey scale height map that indicates the roughness of the surface. Large values in the map mean taller heights, while small values mean lower heights. The values come from the red channel of the input texture.

A normal vector is calculated per pixel using the difference between the intensity of adjacent pixels and then is compressed into the format selected. Note that internally, the format of normal maps is automatically raised to 32-bit floating point precision.

Once the top MIP-map level has been converted to a normal map, lower MIP-map levels are regenerated from this image using the standard 2 by 2 averaging algorithm. This will give physically correct results for per pixel lighting on matte surfaces.

##### Expand to Power of 2

This is a quick function that will expand any size of texture so that its dimensions have values of powers of two although not necessarily equal unless the Make Square option is chosen. Nearest neighbour, Bilinear and Bicubic scaling algorithms are available for this operation.

##### Pre-Multiply Alpha

For alpha-blended rendering it is sometimes useful to have the other, opaque channels of a texture encoded with their value pre-multiplied by the alpha value for each pixel. Clicking Go will carry this out.

##### Bleed Texture

When mapping certain parts of a texture on an object, the texture may contain an invisible void between useful parts. This void creates discontinuities around the textured parts that can impair the

texture compression with certain formats. Uncompressed textures can also benefit from this bleeding operation as texture filtering (bilinear and/or MIP-mapping) can cause undesired adjacent texels to contribute to the final colour being sampled. To avoid this issue, the bleeding process transforms these frontiers by filling the void with a mix from nearby pixels. You can enter this background colour in hexadecimal via the text field, or by clicking on the swatch to the left of the text field and selecting the colour from the image.

### Add Border

PVRTC texture data is assumed to be continuous across texture edges, which is a common case in graphic applications where various material textures like rock, brick, grass etc. are tiled together to represent high texture detail for a larger area. This can occasionally result in minor compression artefacts along the edges of texture data that does not tile.

Whenever results are deemed unsatisfying, this issue can easily be resolved by adding a border around the original texture data. This border will then absorb any possible artefacts related to tiling.

This option has two possible functions depending on the width and height of the texture:

- Width and height both a power of 2. In this case the user can select one of two options. The algorithm will scale the texture down by 8 pixels in the vertical direction (4 on each side) and either 8 or 16 pixels in the horizontal direction, and then add mirrored borders.
- Width and/or height not a power of 2. In this other case, the border is directly added, so as to expand the image dimensions to their nearest respected powers of 2. This way the graphics are not changed by a downsize operation.

**Skyboxes:** Skybox textures are a collection of six textures which are mapped onto a cube to represent the sky or background of a 3D scene. These textures are a special type of non-tiling textures with a very specific tiling behaviour from one texture to another. When filling in the border pixels this special behaviour needs to be taken into account to obtain the best possible end-result in combination with PVRTC. The specific tiling behaviour is illustrated in the PVRTC Texture Compression Usage Guide document from the POWERVR SDK. Skyboxes have six textures, specifically two textures for each major axis: X+ and X-, Y+ and Y-, Z+ and Z-.

To remove potential tiling or texture filtering artefacts the border regions of each texture face need to be filled with the correct data from the neighbouring textures. For instance the borders of the Z+ texture get the top data from the Y+ texture, the bottom border gets data from the Y- texture, the left border gets data from the X- texture and finally the right border gets pixels from the X+ texture.

Saving an image which this has been applied to as a .pvr or .h file will set a flag in the output file's header (see table 2.1.1). For more information, please refer to the PVRTC Texture Compression Usage Guide document that's part of the POWERVR SDK.

A texture pre-processed in this way will have an edge of 4x4 pixels for the PVRTC 4bpp case and an edge of 8x4 for the PVRTC 2bpp case. This texture has to be remapped correctly to restore it to its original size. This remapping can be calculated as follows:

(Note that 1 is added to the border size to avoid bilinear bleeding. ResX and ResY are the original texture resolution)

#### PVRTC 4bpp:

$$u = ((4+1)/\text{ResX}) + u * (1 - (2 * (4+1)/\text{ResX}))$$

$$v = ((4+1)/\text{ResY}) + v * (1 - (2 * (4+1)/\text{ResY}))$$

#### PVRTC 2bpp:

$$u = ((8+1)/\text{ResX}) + u * (1 - (2 * (8+1)/\text{ResX}))$$

$$v = ((4+1)/\text{ResY}) + v * (1 - (2 * (4+1)/\text{ResY}))$$

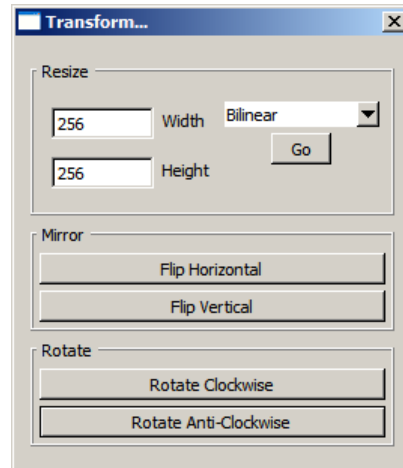

## Colour MIP-maps

Sometimes, for testing purposes, it's useful to mark each MIP-map in the chain by giving it a colour. This option goes through the existing MIP-map chain and colours the levels green, red, yellow, pink, cyan, blue in descending order. It leaves the top MIP-map level unchanged.

### 1.4.2. Transform...

The transform dialog allows basic geometric transformations to be applied to the current texture.

#### Resize

Enter the desired dimensions, in pixels, into the Width and Height boxes, choose the scaling algorithm you desire and press Go. Nearest, Bilinear and Bicubic scaling is available.

#### Mirror

Basic reversal in the horizontal and vertical axes is available through this section of the Transform Dialog.

#### Rotate

Click the option in this section to rotate the current texture by 90 degrees in a clockwise or anti-clockwise direction.

For cube map textures, only the mirror and rotate options are available and these may be applied to the currently selected surface in the Surface Browser or all surfaces at once.

### 1.4.3. Regenerate MIP-maps

This option regenerates the entire MIP-map chain down to the smallest possible size, from the currently selected level, by successively performing 2 by 2 averaging.

### 1.4.4. Get Properties...

Displays some properties of the currently active texture in a floating dialog:

### 1.4.5. Get Encoding Statistics...

Displays some error statistics concerning the difference between input and output images of the current texture:

**Encoding Statistics: lenatestopaque.png**

MIP-map level: 0 Face: 0

Encoding Error Metrics	Red	Green	Blue	Alpha	All
Mean Error	0.302185	0.159790	0.773071	0.000000	0.308762
Standard Deviation	5.711065	4.506449	5.579308	0.000000	3.949206
Mean Square Error	5.719054	4.509281	5.632612	0.000000	3.965237
PSNR db	32.984318	35.048656	33.116608	n/a	36.165421
Maximum Difference	106	62	128	0	128

### 1.4.6. Load MIP-Level/Load MIP-Level Alpha/

These options allow you to load an image into the currently selected MIP-map level, load an image for its alpha channel. The image chosen must match the selected MIP-level or image dimensions.

### 1.4.7. Save MIP-Level

Save an image of the current level after it has been encoded in PNG, JPG, GIF, TGA, PCX or BMP format.

### 1.4.8. Save Cube Map Faces

This option allows the faces of a cube map to be saved in PNG, JPG, GIF, TGA, PCX or BMP format. The filenames will be suffixed by FRONT, BACK, LEFT etc. corresponding to each face.

### 1.4.9. Encode...

This menu displays a dialog box that allows the user to specify the format of texture data produced.

First, choose your target API from the row of tabs at the top. Then choose the texture format that you require from the list in the tab.

Finally, choose the number of MIP-map levels to encode in addition to the actual image. You can also choose to encode the top image alone with the MIP-map selector.

Click Encode and the texture will be processed.

### PVRTC Iterations

You can choose the number of iterations that the PVRTC compressor uses to generate encoded images. Higher numbers will produce higher quality encodings at the expense of speed; lower values will encode faster, but with worsening quality.

### ETC Quality

Varies the setting used by the ETC compressor. Note that Medium and Slow settings may produce higher quality results, but can take very long periods to complete encoding even on modern hardware.

### Vertical Flip

For each API you can set whether the texture is flipped vertically or not. By default, in the POWERVR SDKs, OpenGL, OpenGL ES 1.x and OpenGL ES 2.0 textures are flipped, however, you may not want to leave this box selected for your own applications.

OpenVG textures should be immediately orientated for use with this API and do not have a flip option.

## 2. PVR file format description

The PVR file format is composed of a header followed by texture data. The header is 13 32-bit unsigned integers (52 bytes) long with the following format:

### 2.1.1. File Header description:

DWORD Offset	Content	Description
0	Header Size	52
1	Height	Vertical height of the texture
2	Width	Horizontal width of the texture
3	MIP-map Levels	The number of MIP-map levels present in this file in addition to the main image.
4	0x000000XX	Pixel format identifier – please refer to the table at the end of this document for possible values.
	Format flags:	
	0x00000100	File has MIP-maps.
	0x00000200	Twiddled.
	0x00000400	Normal Map.
	0x00000800	Added border.
	0x00001000	File is a cube map.
	0x00002000	False colour MIP-maps.
	0x00004000	Volume Texture.
	0x00008000	Alpha in texture.
	0x00010000	Texture is vertically flipped.
5	Surface Data Size (bytes).	Size of entire texture, or one cube map face if this is a cube map.
6	Bits Per Pixel	The number of bits of data describing a single pixel.
7	Red mask	Mask for the red channel.
8	Green Mask	Mask for the green channel.
9	Blue mask	Mask for the blue channel.
10	Alpha Mask	Mask for the alpha channel.
11	PVR Id	'P' 'V' 'R' 'I'
12	Number of Surfaces	The number of slices for volume textures or sky boxes

### 2.1.2. File Header Structure

```
typedef struct PVR_TEXTURE_HEADER_TAG{
    unsigned int dwHeaderSize;    /* size of the structure */
    unsigned int dwHeight;        /* height of surface to be created */
    unsigned int dwWidth;         /* width of input surface */
    unsigned int dwMipMapCount;   /* number of MIP-map levels requested */
    unsigned int dwpfFlags;       /* pixel format flags */
    unsigned int dwDataSize;      /* Size of the compress data */
    unsigned int dwBitCount;      /* number of bits per pixel */
    unsigned int dwRBitMask;      /* mask for red bit */
    unsigned int dwGBitMask;      /* mask for green bits */
    unsigned int dwBBitMask;      /* mask for blue bits */
    unsigned int dwAlphaBitMask;  /* mask for alpha channel */
    unsigned int dwPVR;           /* should be 'P' 'V' 'R' '!' */
    unsigned int dwNumSurfs;      /* number of slices for volume textures or skyboxes */
} PVR_TEXTURE_HEADER;
```

Note:

**dwMipMapCount** is the number of MIP-map levels present in addition to the top level. 0 means that there is only the top level, 1 means the top level plus an extra MIP-map level, etc...

PVRTC4, PVRTC2 and formats that use more than 32 bits per pixel do not have **dwRBitMask**, **dwGBitMask** and **dwBBitMask** defined. For PVRTC4 and PVRTC2 **dwAlphaBitMask** will be 1 or 0 depending on whether there exists a pixel in the texture that is less than fully opaque.

## 3. PVRTexTool Command-Line

### 3.1. Description

This is the command-line version of PVRTexTool, and can be found inside the “CL” folder. It exists for Windows and Linux platforms. Only the PVRTexTool executable (PVRTexTool.exe for Windows and PVRTexTool for Linux) is required to run the program.

### 3.2. Usage

PVRTexTool can be used from the command-line to be able to process and compress textures using a batch file. The syntax for the command-line is as follows:

```
PVRTexTool -f<format> -i<inputfilename> [-b<factor>] [-border] [-c<scalar>] [-d] [-dds] [-e] [-m] [-nt] [-h] [-help] [-l<colour>] [-nt] [-ngt] [-o] [-p] [-pvrtciterations<numberof>] [-q<level>] [-r<algorithm>] [-s(filename)] [-t1] [-t2] [-x<width>] [-y<height>] [yflip<0,1>] [-aSrcAlpha[.bmp]] [-o<outputfilename>]
```

#### Options

<b>-a</b>	Input alpha file name ( also BMP, JPG, PNG, GIF or TGA file).
<b>-b[factor]</b>	Bump/Normal map. This option calculates the normal-map from a height-map passed as input. [factor] is a multiplication factor for the normal map. Default value is 2.0.
<b>-border</b>	Preprocess texture for tiling with a mirrored border around the texture. Works the same as the GUI option described above. A texture with dimensions that are non-power of two will be expanded to power of two dimension. For power of two input images the border will be of 4 pixels all round, unless the chosen format is PVRTC2 or OGLPVRTC2 in which case the border generated is 4 pixels at top and bottom and 8 pixels at the sides of the texture.
<b>-d</b>	Create output file(s) with decompressed texture data.
<b>-dds</b>	Create a Microsoft Direct Draw Surface file.
<b>-e</b>	Creates false colour MIP-map levels rather than true levels. The <b>-m</b> must also be set or no MIP-map levels will be generated for false colouring.
<b>-f</b>	Output file format. For example -fPVRTC4 4444, 1555, 565, 555, 888, 8888, 8332, 88, 8, VY1UY0, Y1VY0U, PVRTC2, PVRTC4, ETC, OGL4444, OGL5551, OGL8888, OGLBGRA8888, OGL565, OGL555, OGL888, OGL88, OGL8, OGLPVRTC2, OGLPVRTC4, 1_BPP, DXT1, DXT3, DXT5, 332, 44, LVU655, XLVU8888, QWVU8888, ABGR2101010, ARGB2101010, AWVU2101010, GR1616, VU1616, ABGR16161616, R16F, GR1616F, ABGR16161616F, R32F, GR3232F, ABGR32323232F. Please see the table at the end of this document for further format options.
<b>-h</b>	Create include file with texture data.
<b>-help</b>	Displays information about PVRTexTool similar to that presented here.
<b>-i</b>	Input file name (DDS, BMP, JPG, PNG, GIF or TGA file).
<b>-IRRGGBB</b>	Apply a bleed filter to the texture and its MIP-maps with RRGGBB supplied as a 32-bit hexadecimal colour value.
<b>-m</b>	Automatically generate all MIP-Map levels.
<b>-nt</b>	No twiddle. (Twiddle is enabled by default except for .dds files)
<b>-ngt</b>	Output Nokia NGAGE2 NGT file. This requires use of a PVRTC 4BPP format.
<b>-o</b>	OutputFile name. If this option is not used the output file name will be the same as the input file name with the extension .pvr or .h depending on the relevant options also passed. PVRTexTool will override an incorrect extension.
<b>-p</b>	Create binary PVR file with texture data. This is the default setting if the output type is not specified.

- pvrtciterations** valid values are between 0 and 8. Lower values indicate lower quality output, but faster encoding. Higher values will cause longer encoding times, but higher quality output.
- q** quality mode for ETC compression. 0 = Fast, 1 = Medium, 2 = Slow, 3 = Fast Perceptual, 4 = Medium Perceptual, 5 = Slow Perceptual. Default is 3.
- r** Choose a resizing algorithm. 1 = nearest, 2 = bilinear, 3 = bicubic. Default is bicubic.
- s** Compress a skybox. Files must be named XXXXXn where n=1-6.
- t1, t2** See the **-border** option. The values 1 and 2 are interpreted for backwards compatibility only and are ignored.
- x** Define a new width for the output texture.
- y** Define a new height for the output texture.
- yflip** Flips the texture vertically. Use -yflip1 to force flipping; -yflip0 for no flip.

### Examples

To encode the file Example.bmp as a binary PVR file with pre-generated MIP-maps in ARGB 1555 format.

```
PVRTexTool -m -f1555 -iExample.bmp
```

To encode a sky box from files named skyboxn.bmp as an header include in OpenGL PVRTC 4bpp format:

```
PVRTexTool -h -s -m -fogl_pvrtc4 -iskybox1.bmp
```

## 4. PVRTexTool Plug-ins

### 4.1. Adobe Photoshop CS/CS2/CS3

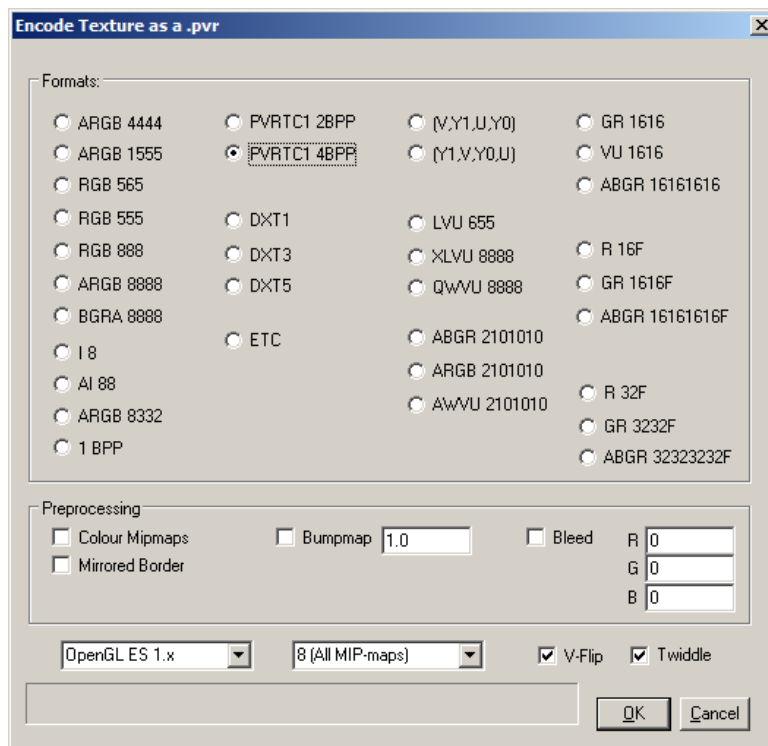

This plug-in for Photoshop allows PVRTexTool capabilities from within this professional image manipulation package.

To install it just copy the file supplied into the folder

***\\Program Files\\Adobe\\Adobe Photoshop CS3\\Plug-Ins\\File Formats***

Or similar.

Once you start Photoshop, PVR will be available as one of the formats supported for loading and also for saving images:

### 4.2. Autodesk 3DStudioMAX v6, 7, 8, 9, 2008, 2009

This plug-in will allow 3DSMax to load the PVR image format. When applying a material, this format will be available in the supported list and it will be displayed properly in the view-ports and final rendered images.

It is possible to save a rendered image in PVR format, but the output format will be limited to 32 bits per pixel to keep quality.

To install this plug-in just copy the file supplied into the folder

***\\Program Files\\Autodesk\\3dsMax<version>\\plugins***

### 4.3. Autodesk Maya

This plug-in, like the previous one, will allow loading of a PVR file as a texture for a material. Equally, when saving an image, the format will be limited to 32 bits per pixel..

To install this plug-in just copy the file supplied into the folder

***\Program Files\Alias\Maya<version>\bin\plug-ins\image***

## 5. Twiddle format description

How it works:

The U and V indices are interleaved in memory as follows: -

U3V3U2V2U1V1U0V0

The subscript denotes the bit position in U or V, which gives an order of texel storage shown below.

**Figure 1. Twiddled Textures**

The grid represents the position in the bitmap, and the number represents the location that it is stored in memory. In the case of rectangular twiddling, the common least significant bits are twiddled, and the left over most significant bits are appended to the top. For example, take a 4 bit U co-ordinate and a 6-bit V co-ordinate. Twiddle the 4 least significant bits of U and V, then append the 2 most significant bits of V onto the top of the result of the twiddling thus: -

V5V4U3V3U2V2U1V1U0V0

Under MGL, source texture data can be twiddled into hardware-friendly format by using the `mglx_texture_twiddle()` function.

When creating a texture with the OpenGL ES API, for instance, the texture source data must *not* be twiddled, as the drivers will perform the twiddling internally prior to uploading the texture to the hardware. PVRTexTool should handle the toggling of twiddling for appropriate texture formats.

## 6. Texture Format Reference

Although some of the formats below are for specific colour spaces PVRTexTool is not colour space aware and it is up to the user to ensure that data from the correct colour space is used with PVRTexTool.

Please note that greyed out formats, whilst present in the PixelType enum, are not supported by PVRTexTool at this time.

Format	Description	Command Line Identifier eg -f4444	Identifier Enum	PVRTexLib Precision Mode	Enum Value
<b>ARGB 4444</b>	Good 16-bit format when smooth translucency is needed.	4444	MGLPT_ARGB_4444	ePREC_INT8	0x0
<b>ARGB 1555</b>	Punch-through 16-bit translucent format.	1555	MGLPT_ARGB_1555	ePREC_INT8	0x1
<b>RGB 565</b>	Best quality 16-bit opaque format.	565	MGLPT_RGB_565	ePREC_INT8	0x2
<b>RGB 555</b>	As 1555 format but alpha is ignored. Good channel balance.	555	MGLPT_RGB_555	ePREC_INT8	0x3
<b>RGB 888</b>	24-bit opaque format with 8 bits for each colour channel.	888	MGLPT_RGB_888	ePREC_INT8	0x4
<b>ARGB 8888</b>	Best quality 32-bit format, but size and performance are worse than 16-bit formats.	8888	MGLPT_ARGB_8888	ePREC_INT8	0x5
<b>ARGB 8332</b>	High quality translucency 16-bit format.	8332	MGLPT_ARGB_8332	ePREC_INT8	0x6
<b>I 8</b>	8-bit intensity only format.	8	MGLPT_I_8	ePREC_INT8	0x7
<b>AI 88</b>	16-bit alpha and intensity format.	88	MGLPT_AI_88	ePREC_INT8	0x8
<b>1BPP</b>	One bit per	1_BPP	MGLPT_1_BPP	ePREC_INT8	0x9

	pixel.				
<b>(V,Y1,U,Y0)</b>	YUV 16-bit format. Used for streaming movies. Good for photographic quality textures.	VY1UY0	MGLPT_VY1UY0	ePREC_INT8	0xA
<b>(Y1,V,Y0,U)</b>	YUV format.	Y1VY0U	MGLPT_Y1VY0U	ePREC_INT8	0xB
<b>PVRTC2</b>	PVRTC compression format. 2-bit per pixel.	PVRTC2	MGLPT_PVRTC2	ePREC_INT8	0xC
<b>PVRTC4</b>	PVRTC compression format. 4-bit per pixel.	PVRTC4	MGLPT_PVRTC4	ePREC_INT8	0xD
<b>OpenGL ARGB 4444</b>	Good 16-bit format when smooth translucency is needed.	OGL4444	OGL_RGBA_4444	ePREC_INT8	0x10
<b>OpenGL ARGB 1555</b>	Punch-through 16-bit translucent format.	OGL1555	OGL_RGBA_5551	ePREC_INT8	0x11
<b>OpenGL ARGB 8888</b>	Best quality 32-bit format, but size and performance are worse than 16-bit formats.	OGL8888	OGL_RGBA_8888	ePREC_INT8	0x12
<b>OpenGL RGB 565</b>	Best quality 16-bit opaque format.	OGL565	OGL_RGB_565	ePREC_INT8	0x13
<b>OpenGL RGB 555</b>	As 1555 format but alpha is ignored. Good channel balance.	OGL555	OGL_RGB_555	ePREC_INT8	0x14
<b>OpenGL RGB 888</b>	24-bit opaque format with 8 bits for each colour channel.	OGL888	OGL_RGB_888	ePREC_INT8	0x15
<b>OpenGL I 8</b>	8-bit intensity only format.	OGL8	MGLPT_I_8	ePREC_INT8	0x16
<b>OpenGL AI</b>	16-bit alpha and intensity	OGL88	MGLPT_AI_88	ePREC_INT8	0x17

<b>88</b>	format.				
<b>OpenGL PVRTC2</b>	PVRTC compression format. 2-bit per pixel.	OGLPVRTC2	MGLPT_PVRTC2	ePREC_INT8	0x18
<b>OpenGL PVRTC4</b>	PVRTC compression format. 4-bit per pixel.	OGLPVRTC4	MGLPT_PVRTC4	ePREC_INT8	0x19
<b>OpenGL BGRA 8888</b>	An OpenGL ES extension- only format offering the same quality as ARGB 8888 in what may be a more desirable channel order.	OGLBGRA8888	OGL_BGRA_8888	ePREC_INT8	0x1A
<b>DXT1</b>	Microsoft S3TC format, 4 bits per pixel with no alpha information.	DXT1	D3D_DXT1	ePREC_INT8	0x20
<b>DXT2</b>	Microsoft S3TC format, 8 bits per pixel. Good for sharp alpha transitions. Alpha is considered premultiplied.	DXT2	D3D_DXT2	ePREC_INT8	0x21
<b>DXT3</b>	Microsoft S3TC format, 8 bits per pixel. Good for sharp alpha transitions.	DXT3	D3D_DXT3	ePREC_INT8	0x22
<b>DXT4</b>	Microsoft S3TC format, 8 bits per pixel. Good for gradient alpha transitions. Alpha is considered premultiplied.	DXT4	D3D_DXT4	ePREC_INT8	0x23

<b>DXT5</b>	Microsoft S3TC format, 8 bits per pixel. Good for gradient alpha transitions.	DXT5	D3D_DXT5	ePREC_INT8	0x24
<b>RGB 332</b>	8-bit opaque format.	332	D3D_RGB_332	ePREC_INT8	0x25
<b>AI 44</b>	8-bit alpha and intensity format.	44	D3D_AI_44	ePREC_INT8	0x26
<b>LVU 655</b>	YUV format.	LVU655	D3D_LVU_655	ePREC_INT8	0x27
<b>XLVU 8888</b>	YUV format.	XLVU8888	D3D_XLVU_8888	ePREC_INT8	0x28
<b>QWVU 8888</b>	Signed 8bit format designed for bump mapping.	QWVU8888	D3D_QWVU_8888	ePREC_INT8	0x29
<b>ABGR 2101010</b>	10-bit precision format with 2 bits for alpha.	ABGR2101010	D3D_ABGR_2101010	ePREC_INT16	0x2A
<b>ARGB 2101010</b>	Another 10-bit precision format with 2 bits for alpha.	ARGB2101010	D3D_ARGB_2101010	ePREC_INT16	0x2B
<b>AWVU 2101010</b>	10-bit precision signed format with 2 bits for alpha.	AWVU2101010	D3D_AWVU_2101010	ePREC_INT16	0x2C
<b>GR 1616</b>	2-channel 16-bit per channel format.	GR1616	D3D_GR_1616	ePREC_INT16	0x2D
<b>VU 1616</b>	2-channel 16-bit per channel format.	VU1616	D3D_VU_1616	ePREC_INT16	0x2E
<b>ABGR 16161616</b>	64-bit format with transparency.	ABGR16161616	D3D_ABGR_16161616	ePREC_INT16	0x2F
<b>R 16F</b>	Single channel 16-bit floating point format.	R16F	D3D_R16F	ePREC_FLOAT	0x30
<b>GR 1616F</b>	2-channel 16-bit floating point format.	GR1616F	D3D_GR_1616F	ePREC_FLOAT	0x31
<b>ABGR 16161616F</b>	64-bit floating point format	ABGR16161616F	D3D_ABGR_16161616F	ePREC_FLOAT	0x32

	with transparency.				
<b>R 32F</b>	Single channel 32-bit floating point format.	R32F	D3D_R32F	ePREC_FLOAT	0x33
<b>GR 3232F</b>	2-channel 32-bit floating point format.	GR3232F	D3D_GR_3232F	ePREC_FLOAT	0x34
<b>ABGR 32323232F</b>	128-bit floating point format with transparency.	ABGR32323232F	D3D_ABGR_32323232F	ePREC_FLOAT	0x35
<b>ETC</b>	Ericsson Texture Compression, 4 bits per pixel with no alpha information.	ETC	ETC_RGB_4BPP	ePREC_INT8	0x36
	Ericsson Texture Compression, 4 bits per pixel with explicit alpha like DXT3.		ETC_RGBA_EXPLICIT		0x37
	Ericsson Texture Compression, 4 bits per pixel with interpolated alpha like DXT5.		ETC_RGBA_INTERPOLATED		0x38
<b>A 8</b>	8-bit alpha texture format.	DX9 A 8	D3D_A8	ePREC_INT8	0x39
<b>VU 88</b>	2 channel 16-bit format.	DX9 VU 88	D3D_V8U8	ePREC_INT8	0x3A
<b>I 16</b>	Single channel 16-bit format.	DX9 I 16	D3D_I16	ePREC_INT16	0x3B

## 6.1. DirectX 10 Formats

Format	Channel Type	Description	Command Line Identifier	Identifier Enum	PVRTexLib Precision Mode	Enum Value
<b>RGBA 32323232</b>	float	High precision formats with alpha support	DX10_R32G32B32A32_FLOAT	DX10_R32G32B32A32_FLOAT	ePREC_FLOAT	0x50

<b>RGBA 32323232</b>	unsigned int		DX10_R32G32B32A32_UINT	DX10_R32G32B32A32_UINT	ePREC_INT32	0x51
<b>RGBA 32323232</b>	signed int		DX10_R32G32B32A32_SINT	DX10_R32G32B32A32_SINT	ePREC_INT32	0x52
<b>RGB 323232</b>	float	High precision formats with no alpha support	DX10_R32G32B32_FLOAT	DX10_R32G32B32_FLOAT	ePREC_FLOAT	0x53
<b>RGB 323232</b>	unsigned int		DX10_R32G32B32_UINT	DX10_R32G32B32_UINT	ePREC_INT32	0x54
<b>RGB 323232</b>	signed int		DX10_R32G32B32_SINT	DX10_R32G32B32_SINT	ePREC_INT32	0x55
<b>RGBA 16161616</b>	float	16-bit precision formats with alpha support	DX10_R16G16B16A16_FLOAT	DX10_R16G16B16A16_FLOAT	ePREC_FLOAT	0x56
<b>RGBA 16161616</b>	unsigned normalised int		DX10_R16G16B16A16_UNORM	DX10_R16G16B16A16_UNORM	ePREC_INT16	0x57
<b>RGBA 16161616</b>	unsigned int		DX10_R16G16B16A16_UINT	DX10_R16G16B16A16_UINT	ePREC_INT16	0x58
<b>RGBA 16161616</b>	signed normalised int		DX10_R16G16B16A16_SNORM	DX10_R16G16B16A16_SNORM	ePREC_INT16	0x59
<b>RGBA 16161616</b>	signed int		DX10_R16G16B16A16_SINT	DX10_R16G16B16A16_SINT	ePREC_INT16	0x5A
<b>RG 3232</b>	float	High precision two channel formats	DX10_R32G32_FLOAT	DX10_R32G32_FLOAT	ePREC_FLOAT	0x5B
<b>RG 3232</b>	unsigned int		DX10_R32G32_UINT	DX10_R32G32_UINT	ePREC_INT32	0x5C
<b>RG 3232</b>	signed int		DX10_R32G32_SINT	DX10_R32G32_SINT	ePREC_INT32	0x5D
<b>RGBA 1010102</b>	unsigned normalised int	10-bit precision format with basic 2 bit support for alpha.	DX10_R10G10B10A2_UNORM	DX10_R10G10B10A2_UNORM	ePREC_INT16	0x5E
<b>RGBA 1010102</b>	unsigned int		DX10_R10G10B10A2_UINT	DX10_R10G10B10A2_UINT	ePREC_INT16	0x5F

<b>RG 1616</b>	unsigned normalised int		DX10_R16G16_UNORM	DX10_R16G16_UNORM	ePREC_INT16	0x67
<b>RG 1616</b>	unsigned int		DX10_R16G16_UINT	DX10_R16G16_UINT	ePREC_INT16	0x68
<b>RG 1616</b>	signed normalised int		DX10_R16G16_SNORM	DX10_R16G16_SNORM	ePREC_INT16	0x69
<b>RG 1616</b>	signed int		DX10_R16G16_SINT	DX10_R16G16_SINT	ePREC_INT16	0x6A
<b>R 32</b>	float	32-bit single channel formats	DX10_R32_FLOAT	DX10_R32_FLOAT	ePREC_FLOAT	0x6B
<b>R 32</b>	unsigned int		DX10_R32_UINT	DX10_R32_UINT	ePREC_INT32	0x6C
<b>R 32</b>	signed int		DX10_R32_SINT	DX10_R32_SINT	ePREC_INT32	0x6D
<b>RG 88</b>	unsigned normalised int	8-bit precision two channel formats	DX10_R8G8_UNORM	DX10_R8G8_UNORM	ePREC_INT8	0x6E
<b>RG 88</b>	unsigned int		DX10_R8G8_UINT	DX10_R8G8_UINT	ePREC_INT8	0x6F
<b>RG 88</b>	signed normalised int		DX10_R8G8_SNORM	DX10_R8G8_SNORM	ePREC_INT8	0x70
<b>RG 88</b>	signed int		DX10_R8G8_SINT	DX10_R8G8_SINT	ePREC_INT8	0x71
<b>R 16</b>	float	16-bit single channel formats	DX10_R16_FLOAT	DX10_R16_FLOAT	ePREC_FLOAT	0x72
<b>R 16</b>	unsigned normalised int		DX10_R16_UNORM	DX10_R16_UNORM	ePREC_INT16	0x73
<b>R 16</b>	unsigned int		DX10_R16_UINT	DX10_R16_UINT	ePREC_INT16	0x74
<b>R 16</b>	signed normalised int		DX10_R16_SNORM	DX10_R16_SNORM	ePREC_INT16	0x75
<b>R 16</b>	signed int		DX10_R16_SINT	DX10_R16_SINT	ePREC_INT16	0x76
<b>R 8</b>	unsigned normalised int	8-bit single channel formats	DX10_R8_UNORM	DX10_R8_UNORM	ePREC_INT8	0x77
<b>R 8</b>	unsigned int		DX10_R8_UINT	DX10_R8_UINT	ePREC_INT8	0x78
<b>R 8</b>	signed normalised int		DX10_R8_SNORM	DX10_R8_SNORM	ePREC_INT8	0x79
<b>R 8</b>	signed int		DX10_R8_SINT	DX10_R8_SINT	ePREC_INT8	0x7A
<b>A 8</b>	unsigned normalised int	8-bit single channel alpha format	DX10_A8_UNORM	DX10_A8_UNORM	ePREC_INT8	0x7B

<b>R 1</b>	unsigned normalised int	1-bit per pixel texture format	DX10_R1_UNORM	DX10_R1_UNORM	ePREC_INT8	0x7C
				DX10_R9G9B9E5_SHAREDEXP		0x7D
	unsigned normalised int			DX10_R8G8_B8G8_UNORM		0x7E
	unsigned normalised int			DX10_G8R8_G8B8_UNORM		0x7F
<b>BC 1</b>	unsigned normalised int	Microsoft S3TC format, 4 bits per pixel with no alpha information.	DX10_BC1_UNORM	DX10_BC_1	ePREC_INT8	0x80
<b>BC 1</b>	unsigned normalised int sRGB colour space	Microsoft S3TC format, 4 bits per pixel with no alpha information.	DX10_BC1_UNORM_SRGB	DX10_BC_1_SRGB	ePREC_INT8	0x81
<b>BC 2</b>	unsigned normalised int	Microsoft S3TC format, 8 bits per pixel. Good for sharp alpha transitions.	DX10_BC2_UNORM	DX10_BC_2	ePREC_INT8	0x82
<b>BC 2</b>	unsigned normalised int sRGB colour space	Microsoft S3TC format, 8 bits per pixel. Good for sharp alpha transitions.	DX10_BC2_UNORM_SRGB	DX10_BC_2_SRGB	ePREC_INT8	0x83
<b>BC 3</b>	unsigned normalised int	Microsoft S3TC format, 8 bits per pixel. Good for smooth alpha transitions.	DX10_BC3_UNORM	DX10_BC_3	ePREC_INT8	0x84
<b>BC 3</b>	unsigned normalised int sRGB colour space	Microsoft S3TC format, 8 bits per pixel. Good for smooth alpha transitions.	DX10_BC3_UNORM_SRGB	DX10_BC_3 _SRGB	ePREC_INT8	0x85
<b>BC 4</b>	unsigned normalised int			DX10_BC_4_UNORM		0x86
<b>BC 4</b>	signed normalised int			DX10_BC_4_SNORM		0x87
<b>BC 5</b>	unsigned normalised int			DX10_BC_5_UNORM		0x88

<b>BC 5</b>	signed normalised int			DX10_BC_5_SNORM		0x89
